

Dear [Name],

We would love to introduce you to Pre De-Icer! Patented, eco-safe product designed to stop ice from bonding **before** the storm. Not a brine, salt, or a typical de-icer it's a completely different approach: a thick, honey-like film that resists wash-off, remains active through precipitation, and works down to **-51 °F** (with a new eco-friendly formulation reaching **-82 °F**).

We have not presented this to the market before and would be excited for you to be the first to review it for potential sale, licensing, or exclusive representation!

Key Differentiators:

- **Smarter Timing:** Applied before the storm, not after eliminating the need for constant reapplication and reducing trucks on the road.
- **Extreme Cold Performance:** Keeps working where salt fails (salt stops working at 27 °F; brine/Beat juice is limited).
- **Viscosity & Longevity:** Formula stays put, mixes with traffic to keep working, and resists wash-off by rain.
- **Eco-Safe:** Salt-free, protecting bridges, overpasses, vehicles, vegetation and waterways from chloride corrosion.
- **Cost-Effective in Danger Zones:** Targeted use on danger spots, like bridges and overpasses, prevents accidents and reduces long-term maintenance costs. Where chloride damage is most severe.

Biggest Near-Term Market: Windshields

- **Windshields:** Consumers and fleets can “never scrape again.” **Apply once before the storm, turn on the wipers, and go** — with clear visibility from the first minute. This is why we see WeatherTech as an ideal first partner to take it to market.

I have a US Utility Patent (#8,119,025) that we believe, fits the WeatherTech legacy perfectly!

The Problem: Right now, your customers buy your floor liners to protect the *inside*, but they still stand out in the freezing cold, scraping ice off the windshield while exposed to road traffic. Dangerous and outdated.

The Solution: "Pre-De-Icer" I developed a viscous, food-grade formula that is applied *before* the storm. Unlike the thin alcohol blends from Prestone that wash away, my formula holds its ground.

- **The Viscosity:** It creates a protective barrier. When an ice storm hits, the ice **melts on contact**—it never forms on the glass.
- **The Blizzard:** Even if snow piles up a foot deep, it sits on top of the film. It never bonds.
- **The Experience:** You walk out, hit the wipers, and drive away while your neighbors are still hacking away at their windshields.

Additional Niches:

- Commercial/Residential Walkways & Driveways
- Commercial Trucking
- Government and Military Equipment/Applications
- Boat docks,
- Boats/Ships
- Commercial & Residential Roofs
- Airport/Aircraft De Icing Applications
- Are just some viable markets for expansion.

We are now ready to sell, or lease the intellectual property (U.S. utility patent included) and bring this to market with the right company.

I would welcome a brief call to discuss its commercial potential and answer questions. We are excited and ready to move forward quickly.

Best regards,
