

MARTY - make your notes in GREEN, I'll make mine in BLUE.

That way we can understand our notes back and forth.

The Steps To Making Money w VoxTalk

First pass at the non-negotiable steps to taking VoxTalk from where it is now, to something lucrative that we can get paid for.

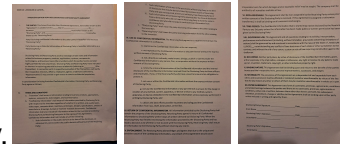

Got it — I've read your VoxTalk document. You're right: this could be a big deal, but being a lone programmer without Silicon Valley credibility means you have to be very deliberate in how you package, protect, and present it. Here's a **step-by-step sequence, in strict order**, tailored to your situation (older, solo, prefer remote/online over in-person).

Non-Negotiable Steps in Order

1. Protect What You've Built

1. **Make sure GitHub repos are PRIVATE and not PUBLIC.**
 - a. Click Settings (top menu).
 - b. Scroll to Danger Zone → "Change repository visibility."
 - c. Switch from Public → Private.
2. **Own the IP clearly:** Make sure your code is tracked in a private Git repo **with timestamps.**
3. **File at least a provisional patent** on your unique differentiators (noise suppression + human fallback, toolbar integration, memory). This buys you a year of protection. (does have a good chance, according to chat)

4. **Draft basic NDAs** so you can share your demo safely.
ok.....9/6..my Dad's Birthday!!!

Lmk if

Notes: Arguably, we could finish the demo first as long as the GitHub repos are locked down/private. Yes they are locked and btw...going to learn [Fly.io](https://fly.io) and replace Render with it...[Fyi.io](https://fyi.io) is great..love it

2. Package It for Business Eyes THIS IS THE OBVIOUS FOCUS. THESE STEPS BELOW have to be done before anyone will take VT seriously.

4. **Polish your demo:** Short, 90-second video showing VoxTalk ordering a tricky part or navigating a noisy environment. No code shown.
- a. **Things that the DEMO NEEDS - this is your TO DO list for now mah fren:**
 - b. **I uploaded the zipped repo into the Marty folder, and here's the HoldTheBacon demo URL → <https://holdthebacon.onrender.com> this is the one i am actively working with. Once done will share files with VoxTalk so we have the mothership, and then i will start modifying <https://holdthebacon.onrender.com> for whichever we want to first create. [Holdthebacon url is not working. I am constantly working on it..its down more than working...9/6](https://holdthebacon.onrender.com)**

Two Folders [_voxtalk- headless](#) & [hold-the -bacon](#)

Great I'll look at it when I get home tonight. Need laptop

- i. Doesn't crash/stall etc
- ii. Doesn't go silent. Right now, when I ask it to do things, it goes silent for long periods or several minutes.
- iii. Develop a use case, such as finding Corvette Parts. The person viewing the demo isn't looking for seamless voice to voice talking probably. They need to see a USE CASE that helps them understand the commercial potential.
- iv. User needs to understand if VT is LISTENING, or SPEAKING, or PAUSED.

- v. Need to add ability for VT to access and reference external data file such as a parts or menu database. This database can be a single external text file like a .CSV for now. Someday we would want to extend this but a .CSV file should suffice for now. [I can create one for you quickly if needed.](#)
 - vi. Needs to run on most major browsers (desktop or mobile) [I think it does this already which is great.](#)
5. **Create a one-pager** (simple PDF) that frames the problem (e.g., McDonald's meltdown), your differentiators, and how it makes businesses money. [I can do this after the demo is done.](#)
6. **Make a lean website** (single landing page) with:
- Demo video [I can help on this after the demo is done.](#)
 - "How it works" diagram [I can help on this after the demo is done.](#)
 - Clear contact form (for buyers/partners) [I can help on this after the demo is done.](#)
-

3. Define How You'll Sell

7. Decide your monetization model:
- **Outright sale** (one-time payout, you walk away)
 - **Licensing** (recurring revenue, but you keep maintaining the codebase)
 - **Partnership/third-party service** (you operate the tech for clients)
Pick *one primary path* so buyers don't think you're aimless.
 - [I wrote this then asked chat to clean it up](#)....obviously all this when demo's are complete and this is what i have thought of occasionally since starting this journey....
-

4. Build Credibility Without Being Seen

8. **Use your materials as a proxy for you** — demo, website, PDF must look pro. They become your “face.”
 9. **Skip in-person:** Rely on Zoom, phone demos, email outreach. That's normal today; plenty of founders do it.
-

5. Identify & Reach Acquirers

10. Make a **short list of target industries**: auto parts, appliances, restaurants, healthcare.
 11. Within those, identify **innovation/product leaders** (e.g., VP of Digital, Head of AI, Corporate Dev).
 12. Leverage **LinkedIn warm introductions** (your pitch deck/PDF makes intros easier).
 13. If you can't get intros, **cold pitch with demo video link** — that alone sets you apart.
-

6. Enter Conversations Safely

14. Start with the **demo and one-pager**, not the code.
 15. Get NDAs signed before sharing more.
 16. If they're interested, **loop in a tech/startup lawyer** immediately before any contract talk.
-

7. Negotiate for Lucrative Exit

17. Have your lawyer handle:
 - IP transfer terms
 - Payment structure (cash upfront vs. royalties)
 - Non-compete / ongoing obligations (important since you're solo).

18. [Talk to multiple companies at once so you have leverage — never let it look like they're your only option.](#)
-

The Core Flow (Simplified)

1. Protect → 2. Demo/Website → 3. Monetization decision → 4. Outreach → 5. NDA → 6. Lawyer/Negotiation → 7. Close
