

Edit

My opinion? If your goal is eventually to **sell the company**, I'd lean toward a **subscription/service model**, but not a pure lease.

I'd structure it like this:

SiteEye LIVE™ Service

Customer pays:

- Initial setup fee
- Monthly service fee

They receive:

- Hardware
- Cellular connectivity
- Dashboard access
- Support
- Software updates

Why?

Because companies that buy businesses often pay higher multiples for **recurring revenue** than for one-time hardware sales.

Example

Company A:

- Sells 500 units at \$2,000 each.
- Makes revenue once.
- Must constantly find new customers.

Company B:

- Has 500 units deployed.

- Generates \$89/month per unit.
- Has predictable recurring revenue.

Acquirers usually find Company B more attractive because they can forecast cash flow.

But...

I would still offer an outright purchase option.

Not because you want people to choose it.

Because some contractors hate subscriptions.

So:

Option	Basic	Pro
Service	\$399 setup + \$89/mo	\$999 setup + \$119/mo
Purchase	\$1,999	\$3,999

If 80–90% choose the service, great.

If a contractor insists on ownership, you don't lose the sale.

What I'd do in the first 12–24 months

Honestly?

Don't over-engineer the business model yet.

Build:

1. One prototype.
2. Put it in Joe's hands.

3. Let Joe use it on real jobs.
4. Let Tony beat up the economics.

Then you'll learn things you can't predict today:

- Do crews tolerate it?
- Does it survive wind and weather?
- Does Joe actually check it?
- Is \$89/month a bargain or too much?
- What breaks first?

Those answers will drive the business model more than any spreadsheet.

If Joe uses it for 30 days and says:

"I can't imagine running my crews without this now."

That's when you start thinking seriously about patents, manufacturing, and whether you're building a hardware company, a software company, or a service company.

Right now, if I had to choose one path with the information we have:

Service/subscription first, purchase option second.

That's the model I'd bet on if the long-term goal is building value and eventually selling the company.

Okay, now redo the images with the correct pricing on it.

Edit

again that have some of the materials. Can you give me the websites again that have the materials to build the prototype?

Absolutely. For a **prototype**, I would avoid specialty surveillance suppliers at first and use readily available parts.

1. Telescoping Mast / Pole

Spiderbeam

- [Spiderbeam Fiberglass Masts](#)
- Lightweight fiberglass poles
- 12–18 ft options
- Good prototype choice

Max-Gain Systems

- [Max-Gain Systems](#)
- Telescoping fiberglass masts
- Popular with radio and camera projects

DX Engineering

- [DX Engineering](#)
 - Carries multiple mast brands
-

2. Tripod

Glide Gear

- [Glide Gear](#)
- Tall camera tripods and mast systems

Manfrotto

- [Manfrotto](#)
- Commercial-grade tripods

For Joe's prototype I'd lean toward a heavy-duty tripod first because it's universal.

3. 360 Camera

Insta360

- [Insta360](#)
- X3
- X4
- X5

Probably the easiest prototype camera.

Ricoh Theta

- [Ricoh Theta](#)
 - Simpler 360 cameras
-

4. Cellular Connectivity

Verizon Business

- Verizon Jetpack Hotspots

Netgear

- [Netgear Nighthawk Mobile Hotspots](#)

I'd rather use a dedicated hotspot than a burner phone for the production version.

5. Weatherproof Case

Pelican

- [Pelican Cases](#)

Probably the industry standard.

6. Flashing Beacon

Federal Signal

- [Federal Signal](#)

For prototype purposes, Amazon beacon lights are fine.

7. Battery System

Anker

- [Anker Power Banks](#)

EcoFlow

- [EcoFlow Portable Power Stations](#)
-

My Prototype BOM

If I were spending money tomorrow:

Component	Vendor
15 ft mast	Spiderbeam
Tripod	Glide Gear

Camera	Insta360 X4
Hotspot	Verizon Jetpack
Battery	Anker
Case	Pelican

Expected prototype cost:

\$700–\$1,500

depending on how commercial-grade you go.

For manufacturing later, I'd source direct from overseas factories or U.S. wholesalers. But for Joe and Tony's first working unit, I'd buy retail, get it deployed fast, and see if they actually use it every day. That's the test that matters most right now.
