

Pre-De-Icer™ — A Preventive Approach to Winter Ice

Inventor: Martin Simpson

Status: Patented technology · Never commercialized

Introduction

Hello, my name is Martin Simpson. I invented Pre-De-Icer.

This is the first time I've shared it outside my inner circle, and I'm proud to introduce it to WeatherTech. Your company has built its reputation on prevention, protection, and trust—those same principles are exactly why Pre-De-Icer exists.

What Pre-De-Icer Does

- **Prevents ice from bonding before it forms**—rather than melting ice after it's already dangerous
 - **Stays in place during precipitation**—its viscosity resists wash-off on vertical and angled surfaces
 - **Works in extreme cold**—effective well below temperatures where salt, brine, and sprays fail
 - **Reduces labor and risk**—one preventive application replaces multiple reactive passes
 - **Protects vehicles and infrastructure**—non-corrosive, paint-safe, and environmentally responsible
-

Why It's Different

Most winter products are reactive and short-lived. You wait for ice to form—then scrape, spray, or reapply.

Pre-De-Icer is preventive and long-lasting.

Its key differentiator is **viscosity**. Rather than a thin liquid that washes away, Pre-De-Icer forms a gel-like coating that disrupts ice crystal formation at the surface. Ice does not adhere—and if ice or snow is present, it releases instead of bonding.

This same viscosity allows the product to remain effective during changing conditions, including light rain before snow.

The Result

Ice rests on top of the surface instead of bonding to it.

When ready to use, **one swipe clears it—no scraping required.**

Where It Applies

Windshields — the immediate opportunity

Think about a winter convenience store: scrapers, brushes, de-icers, washer fluid. Every product is reactive. There is nothing designed to go on a windshield *before* a storm to prevent ice in the first place.

Pre-De-Icer changes that.

Apply it before the event. When it's time to drive, turn on the wipers—snow and ice slide off. Immediate visibility. No scraping. No frozen wipers. No exposure.

Additional applications (expansion):

- Walkways and driveways
- Bridges and overpasses (critical danger zones)
- Commercial parking lots
- Trucking fleets and equipment
- Government and military assets

- Roofs (collapse prevention), docks, and marine surfaces
- Airport ground operations and runways

Windshields are the fastest path to market. Everything else is expansion.

Closing

I'm an inventor, not a distribution company. WeatherTech excels at bringing practical, preventive products to market, and I believe Pre-De-Icer belongs under your name—not mine.

I'm open to an outright sale of the intellectual property or a licensing structure that gives WeatherTech full control of branding, positioning, and scale. I'd welcome a conversation to explore what makes the most sense for you.
